Mild Traumatic Brain Injury and Concussions

James J. Lehman, DC, MBA, FACO
Associate Professor of Clinical Sciences
University of Bridgeport College of Chiropractic
Learning Objectives

• Increase awareness of Mild Traumatic Brain Injury (MTBI) evaluation and management
• Realize the need for patient-centered evaluation and management of MTBI patients
• Availability of MTBI online education and credentialing
• What have been your experiences with concussion or MTBI?
Mild Traumatic Brain Injury (MTBI) or Concussion Incidence

• Approximately 3.8 million Americans per annum in sports related activities
MTBI Incidence

- Approximately 50% of the MTBI athletes do not report the injury to a health professional...

Confusion

- Hallmark symptom of TBI is confusion
- Eyes glassy, loss of focus
- Incoherent speech
- Going to wrong team's huddle
- Memory Loss
  - Loss of memory prior to event-retrograde amnesia
  - Loss of future memory-anterograde amnesia
Mild Traumatic Brain Injury (MTBI)

• An injury to the head due a blunt trauma or acceleration or deceleration forces that result in one or more of the following (mental status changes) signs or symptoms...

• National Center for Injury Prevention and Control
MTBI Mental Status Signs or Symptoms

- Transient confusion
- Disorientation
- Impaired consciousness
- Dysfunction of memory around time of injury
- Loss of consciousness lasting less than 30 minutes
Observed Signs of Neurological or Neuropsychological Dysfunction (children)

- Seizures post head injury
- Irritability, lethargy, or vomiting following head injury (infants or young)
Observed Signs of Neurological or Neuropsychological Dysfunction (adults)

- Seizures post head injury,
- headache,
- dizziness,
- irritability,
- fatigue or poor concentration,
- loss of consciousness or altered consciousness
- when identified soon after injury.
Glasgow Coma Scale

### GLASGOW COMA SCORE

#### Eye(s) Opening
- Spontaneous: 4
- To speech: 3
- To pain: 2
- No response: 1

#### Verbal Response
- Oriented to time, place, person: 5
- Confused/disorientated: 4
- Inappropriate words: 3
- Incomprehensible sounds: 2
- No response: 1

#### Best Motor Response
- Obey's commands: 6
- Moves to localised pain: 5
- Flexion withdraws from pain: 4
- Abnormal flexion: 3
- Abnormal extension: 2
- No response: 1

*Best response: 15
Comatose patient: 8 or less
Totally unresponsive: 3*
Concussion
Definition

A traumatically induced transient disturbance of brain function and involves a complex pathophysiological process.

American Medical Society for Sports Medicine
Concussion Definition

Concussion is a subset of mild traumatic brain injury that is generally self-limited and at the less severe end of the brain injury spectrum.

American Medical Society for Sports Medicine
School of hard knocks
A concussion occurs when a violent blow to the head causes the brain to slam against the skull beyond the ability of the cerebrospinal fluid to cushion the impact. Between 1996 and 2001, NFL teams reported nearly 900 concussions.

1. When a football player takes a hit to the head, speeds range from 17 to 25 miles per hour with a force averaging 98 times the force of gravity.

A study commissioned by the NFL revealed most hits occurred from a blow to the side of the head, often on the lower half of the face.

2. The shock wave passes through the brain and bounces back off the skull. The concussion usually occurs at the opposite side from the point of impact.

Symptoms
Immediate
Confusion
Amnesia
Loss of consciousness
Ringing in the ears
Nausea and vomiting
Convulsions

Delayed
Irritability
Headaches
Depression
Sleep disorders
Poor concentration
Trouble with memory

Cumulative effects
Studies show that prior concussions may lower the threshold for subsequent concussion injury and increase severity of symptoms.

Bloodless Concussion: The Misunderstood Injury

Athletic trainers, coaches, medical staff, parents, and injured players often perceive that a concussion is unimportant because no blood or other obvious clinical signs are visible.
Concussion is used interchangeably with mild traumatic brain injury (MTBI) and should not be interpreted as clinically insignificant in terms of:

- risk,
- attributable factors,
- detection,
- diagnosis,
- management,
- treatment,
- or follow-up care.

Other health problems, such as uncontrolled diabetes, severe dehydration, and adverse drug reactions, can cause signs and symptoms similar to concussion.

Signs of Dehydration:
* Increased thirst
* Dry mouth
* Light-headed
* Fatigue
* Impaired mental focus
* Low urine output
* Inability to produce tears
* Sunken Eyes
* Dry skin
## Signs of Dehydration

**Early Signs**
- Fatigue
- Anxiety
- Irritability
- Depression
- Cravings
- Cramps
- Headaches

**Mature Signs**
- Heartburn
- Joint Pain
- Back Pain
- Migraines
- Fibromyalgia
- Constipation
- Colitis
Hydration: Fluids for Life

- This monograph provides readers with an overview of current knowledge related to the functions of water, methods of determining hydration status, sources of water in the diet, and for infants, children, physically active individuals, and the elderly.
• The effects of cerebral concussion on postural control persist for longer than three to four days, even among athletes with no signs of unsteadiness.

Diffuse Axonal Injury

- It has been reported that impact acceleration to the head causes traumatic brain injuries (TBI) with damage to the white matter tracts composed of long axons traversing the brain.
Deadly Uppercut

- The acceleration-deceleration shearing forces generated by motor vehicle accidents and the rotational shearing forces generated with boxing, most especially the uppercut, cause diffuse axonal injury.

Diffuse Axonal Injury

• The initial response to mechanical axonal injury is reversible.

• Incomplete clinical evaluation of the involved white matter and early return to unrestricted activities may lead to secondary insults and irreversible axonal fragmentation.
American College of Sports Medicine

• Attempts to assist the team physician in providing optimal medical care for athletes who have experienced a concussion. To accomplish the goal, the college suggests that all team physicians should have knowledge of and be involved with the following:
American College of Sports Medicine

- Epidemiology
- Pathophysiology
- Gameday evaluation and treatment
- Post-gameday evaluation and treatment
- Diagnostic imaging
- Management principles
- Return-to-play
- Complications of concussion
- Prevention
American Medical Society for Sports Medicine Position Statement: Concussion in Sport

• *The ideal care of athletes with sports concussion should be performed by health care professionals with specific training and experience in the assessment and management of concussion.*

• Hence, the sports medicine position intends to assist sports medicine physicians, other physicians and health care professionals in the care of patients with sports concussion.

• This integrative mentality appears to support the National Prevention Strategy: America’s Plan for Better Health and Wellness recommendation to enhance coordination and integration of clinical, behavioral and complementary health strategies.
Conclusions

• Injured individuals are usually not aware of their MTBI and often do not seek care.

• In order to improve the treatment of these patients, all health care providers should become more aware of best practices and evidence-based care of MTBI and concussion.

• All health providers treating athletes should become familiar with the guidelines for evaluation and management of patients with MTBI.

Assignments

1. Complete Heads Up and remit certificate for one-hour of credit.
2. Complete “BrainLine-Military” course and remit certificate of completion to UB HSPED for an additional five (5) hours of credit toward orthopedic hours and gain certificate of completion demonstrating training and awareness of evaluation and management of MTBI.
3. There are no charges for the five hours of BrainLine Military credits.
